EXECUTIVE SUMMARY

The Town of Falmouth operates an anchorage field with over 1,250 moorings under USCG Special Anchorage regulations. The primary means of accessing the waterfront and anchorage field is through the Town Landing, a municipal pier located off of Foreside Road (Route 88). The Falmouth Anchorage is facing excessive demands for mooring permits with severely limited parking and water access capabilities. There is an inherent connection between the anchorage, dinghy and launch service, and land-side parking that cannot be evaluated individually. Any long-term management plan must consider the impacts of one change on the other related operational issues.

Starting with the land-side facilities, the available parking for the users of the Town Landing is inadequate for the current operation. Long-term improvements are needed to meet the current demand, and any future increase in the number of moorings should consider an equivalent increase in the parking areas. To meet current demand, the town will need to construct approximately 100 new parking spaces at a cost around \$250,000 not including land acquisition, design, and permitting fees.

The use of dinghies from Town Landing as the sole source of access to moorings is reaching its limit. The current system of storage of 90 dinghies creates a significant burden for the Harbormaster and his staff, does not adequately meet the needs of the users given only 1 in 4 boat owners are permitted each year, and the allotment of dinghy storage appears to be inequitable. If the available parking is improved to meet current demand, the ability to reach moorings will be the next restrictive condition limiting long-term operations. In order for the Town Landing access point to expand and allow for managed growth in the number of moorings, a launch service is the only means to achieve this goal.

The Falmouth Anchorage is experiencing the effects of years of growth without a long-term management plan. Mooring installations and locations occurred haphazardly over the years with no plan for future expansion. A GIS-based management software will allow the Harbormaster to actively manage the significant number of moorings while a long-term anchorage wide repositioning of the moorings will allow for improvements to maneuvering, safety, and efficiency of the anchorage. While anchorage-wide repositioning will improve operations, this effort will require 8 to 10 years of effort, or more depending on resistance to change.

A repositioning of moorings in association with increased parking and a possible launch service will take numerous years to complete in order to limit the cost implications but will ultimately lead to the orderly operation of a significant town resource, its waterfront. Given economic trends and political will, the Town will need to concentrate on following the long-term management plan in order to be successful.

FALMOUTH ANCHORAGE EVALUATION
PHASE II: LONG-TERM MANAGEMENT AND OPERATIONS
FALMOUTH, MAINE

INTRODUCTION

The Town of Falmouth, Maine, manages and operates one of the largest mooring fields in the State of Maine. At the start of the 2008 boating season, over 1,250 mooring applications have been received for the use of a mooring in the USCG Special Anchorage for the Town of Falmouth (the “Falmouth Anchorage”). The management and operation of the Falmouth Anchorage is regulated by the Falmouth Coastal Waters Ordinance (the “Ordinance”), with revisions adopted through November 27, 2006. Under the Ordinance, the Falmouth Harbor/Waterfront Committee (the “Committee”) is charged with the task of “studying and evaluating public use and access to coastal waters.” The Harbormaster, a member of the Falmouth Police Department, is charged with enforcement of the regulations and the operation of the Falmouth Town Landing.

In the implementation of its duties to study the Falmouth Anchorage, the Committee retained the services of Northeast Engineers and Consultants, Inc. (“NEC”) to perform the first phase of a long-term management plan. The first phase evaluated the current operations of the Falmouth Anchorage and identify deficiencies that needed to be addressed by the Committee. The Committee then retained the services of Milone & MacBroom, Inc. (“MMI”) to provide recommendations for long-term management and operational improvements for the Falmouth Anchorage. This report includes:

- Review of Phase I Report
- Anchorage Access and Parking Requirements
- Dinghy Utilization and Launch Service Requirements
- Anchorage-Wide Repositioning of Moorings

The long-term report is intended to provide the Committee with recommendations to each of the report items, including possible changes to the Coastal Waters Ordinance, improvements to shore-side facilities, and options for streamlined anchorage access. This report sets out a series of steps and recommendations that will eventually lead to the improved management and operation of the Falmouth Anchorage, with the ultimate goal of allowing new moorings to be installed as conditions improve.

The implementation of long-term management changes will not correct deficiencies within a year or two, but will take many years of small incremental changes to achieve the report goals. Over the years, the Falmouth Anchorage was allowed to expand with limited oversight and enforcement and has reached its limitations. From the current configuration of moorings to the limited shore-side facilities to support the use, the Falmouth Anchorage would be greatly enhanced with the implementation of a long-term management and operations plan.

1.0 REVIEW OF PHASE I REPORT

1.1 Background

The Committee, through its previous consultant, completed Phase I of the study during 2007, with a report issued on October 16, 2007. While minor revisions were made through the winter of 2007 and issued on March 5, 2008, the evaluation of current operations was principally complete by the end of October. The report was divided into three major study components; 1) Vehicle Access Report, 2) Vessel Access Report, and 3) Mooring Field Report. Due to this existing format, this report was organized in a similar manner but looked at the Falmouth Anchorage as a complete picture.

The Phase I report generally looked at each component as a separate “report”, where a summary, methodology, and findings and conclusions for each were provided. This does not adequately correlate how all three items are interrelated; one section cannot be properly evaluated without looking at the management and operation of the other components. In the preparation of this report, MMI reviewed all available data generated from the Phase I effort, including field surveys on parking and design plans.

The Phase I report provides detailed background data on the anchorage access, dinghy utilization, and mooring issues, but does not provide clear recommendations to improve long-term management of the Falmouth Anchorage or how they are related to one another. Specific recommendations are limited to peak, or infrequent, observations and do not address long-term management and operations on a daily or weekly basis. Based on our review of the Phase I report, the following sections identify areas that require further consideration by the Committee.

1.2 Phase I Data

The data generated from the Phase I report was reviewed in detail going back to the original data source. Within each “report” section, the source of the data used in the analysis was reviewed to determine accuracy and appropriateness. While a few issues were identified within the Phase I analysis, we were generally comfortable with the data source and incorporated this information into the Phase II work.

1.2.1 Data from Town Landing Users

The data generated for the Vehicle Access Report was obtained from field surveys of Town Landing users on June 23, July 4, August 9, and August 11, 2007. A separately bound report, prepared by NEC on August 10, 2007, provides an initial review of the field surveys, including the actual questionnaires used in the survey for June 23, 2007. We were able to reproduce similar results by performing a field survey on June 21, 2008, and gained a level of confidence in the data source.

The field surveys from Town Landing users were limited with respect to parking utilization at the Town Landing or other locations. Specifically, no data was found to support long-term recommendations on the necessary parking requirements except for the field surveys discussed above. The report made reference to a 1988 report from the International Marina Institute, but the applicability to the Falmouth Anchorage would not be reasonable. Marina's, consisting of full services, boat slips, and a few open-water moorings should not be compared to the Falmouth Anchorage with limited services, as they concluded. Further review and recommendations are provided in Section 2.0 of this report.

Similarly, the field surveys were limited with respect to dinghy utilization at the Town Landing, or supporting information for the operation of a launch service. While some questions were asked of users and on-line responses were tabulated, the information could not be considered representative or reproduced. However, this does not nullify the conclusions and is discussed more in Section 3.0 of this report.

1.2.2 Data from Town Mooring Database

Another source of data used in the Mooring Field Report was the Town Mooring database maintained by the Harbormaster and town staff (refer to Appendix A for data used in the preparation of this report). Part of the mooring application process, applicants provide the town with basic information about themselves, their boats, their moorings, and other associated information. With each mooring there is a required 2 year inspection requirement, and the mooring database is updated as the inspection forms are returned to the Harbormaster.

The Phase I report does not address or attempt to indicate some of the errors or data format of the mooring database. The accuracy of the Latitude/Longitude coordinates is mentioned in the report, and is clearly a question that needs to be addressed. This issue is being addressed by the Harbormaster in the form of a new GIS-based mooring management software program developed specifically for this purpose.

However, the Phase I report does not identify limitations in the accuracy of the remaining data, and some findings and conclusions of the report are based on inaccurate mooring information. One example of the data format irregularities is found when comparing the number of applicants accessing their mooring from one specified location, such as Handy Boat Service, versus the number of customers in the Handy Boat Service database; the mooring data does not indicate any veracity with small margins of error. Further review and recommendations are provided in Section 4.0 of this report.

1.3 Economic Trends and Impacts

While this report does not contain any direct discussion of economic impacts or market conditions, we feel it is appropriate to briefly discuss the current economic trends that are occurring at the time of this report. It was observed, and mentioned through discussions with all daily waterfront users, that the cost to own, operate, and fuel a boat was increasing rapidly while economic trends were limiting waterfront users by decreasing trips or number of days that a boat is in the water. The Phase I report, as well as this report, is based on observations over the past 2 years and a review of trends from historical data. Changes in economic trends will certainly alter these patterns and any future management changes should carefully consider changes in the utilization of the Falmouth waterfront.

Another economic impact not specifically addressed in this report is the economic impacts to existing businesses and/or waterfront users. The Town needs to carefully consider what economic impacts will occur as a result of long-term changes in the Falmouth Anchorage. It is beyond the scope of this report and our area of expertise but there are certain positive and negative economic impacts that result from operational changes that need to factor into any decision.

1.4 Conclusion and Recommendations

The review of the Phase I report indicates some minor areas that require the attention of the Committee and the Harbormaster. The Harbormaster is implementing a GIS-based mooring management software program to maintain and improve the long-term operation of the Falmouth Anchorage. We recommend that the veracity of the existing mooring database be thoroughly reviewed, and updated as necessary, to clearly reflect the current operations of the waterfront. We understand this process was difficult under historic conditions; the new GIS-based database should greatly enhance this process and improve the quality of the reporting by the Harbormaster.

The Committee and Harbormaster should investigate ways to verify the data being provided in the application form, or modify the form to ascertain more accurate descriptions of each item. Some specific recommendations to consider include:

- 1.4.1* Modify the application form to create three clearly defined and separate sections for applicant information, mooring information, and boat information, and possibly allow multiple mooring permits on one applicant form.
- 1.4.2* Applicant information should clearly indicate the proposed access point, and if other than the Town Landing they should include rights to use said access point.

1.4.3 Mooring information should include the latest inspection report for the mooring regardless of the year it was done. We recommend the Harbormaster verify 20-percent of moorings each year to verify the accuracy of the mooring location.

1.4.4 Boat information should indicate whether an existing or new boat is being moored in the Falmouth Anchorage, as boat size directly impacts the surrounding area.

2.0 ANCHORAGE ACCESS AND PARKING REQUIREMENTS

2.1 Anchorage Access

There are three primary access points to the Falmouth Anchorage, which include Town Landing (public use), Portland Yacht Club (private use), and Handy Boat Service (commercial use). There are many private landowners and associations that maintain and operate private access points to the Falmouth Anchorage. A review of the mooring database indicates the following breakdown of anchorage access:

Town Landing	353	(30%)
Handy Boat Service	347	(29%)
Portland Yacht Club	334	(28%)
Other Falmouth Access Points	127	(11%)
<u>Other Access Points</u>	<u>26</u>	<u>(2%)</u>
Total Anchorage Access	1187	(100%)

As the data indicates, the anchorage access from the private access points is relatively small compared to the three primary access points. The allowable number of boats accessing from private access points will have minimal impact on the long-term management and operation of the Falmouth Anchorage. Please note that this information is subject to change as the mooring database is upgraded and verified.

Anchorage access to the mooring field is currently limited by the available land-side facilities, principally available parking, dock space, and launch capability. Currently, Handy Boat Service is operating below capacity as determined by available facilities and historic utilization (total number of moorings in the past). Based on the existing facilities, Handy Boat Service could support anchorage access for an additional 55 moorings bringing their total anchorage access up to ~400 moorings.

Portland Yacht Club is operating at capacity as determined by the total number of members allowed into the club. As a private organization, the Portland Yacht Club currently has full membership with no expansion anticipated. Based on the existing facilities, an additional 25 moorings could be added for members bringing their total anchorage access up to ~360 moorings. However, this increase in size without new members would not be a realistic assumption.

The Town Landing, on the other hand, is currently operating well above capacity; the principle limiting factor is available parking. Recent improvements to the Town Landing facility increased the dock space and allowed for greater utilization but there is a severe shortage of available parking and launch capability. Based on the existing 50 striped parking spaces and available street parking on Johnson Road (refer to Section 2.3 for a detailed review), the Town Landing would normally operate at a capacity of 225 to 250 moorings, well below the current ~350 moorings.

2.2 Town Landing Utilization

The Town Landing facility is a public facility, which is used by boaters and non-boaters alike. The facility sees a large number of users sightseeing, dog walking, accessing the beach, launching kayaks, eating lunch, and fishing from the docks. The exact utilization of the Town Landing was initially reviewed in the field surveys but not clearly defined.

Building on the data obtained during the Phase I, we performed a field survey of the Town Landing on June 21, 2008, to observe the operation of the facilities during a typical tide cycle on a Saturday. The data collected correlates very well to previous data and generally supports the utilization trends at the Town Landing. The number of vehicles and pedestrians entering the Town Landing facility was counted, and each trip was then documented as to their intended activity. The observations were separated into three categories, which include 1) water-based activities like boat launches and dinghy access, 2) land-based activities like dog walking and beach access, and 3) vehicles that entered and exited immediately. The observations in the last category were common when the parking spaces were occupied, but no activity was recorded for that vehicle.

Observations were tabulated as activity occurrences based on a total of 763 observed vehicles/pedestrians accessing the landing, and are summarized in the following table:

<u>Water-based Activity</u>	307	(40%)
Access Dinghy	149	(20%)
Launch Dinghy/Kayak	77	(10%)
Launch Boat	74	(10%)
<u>Land-Based Activity</u>	459	(60%)
Sightseeing/Parking	210	(27%)
Beach Access/Walking/Misc.	229	(30%)
Fishing from Pier	20	(3%)

The Town Landing utilization indicates a majority of people using the facility are for land-based activities, with a corresponding small amount of time spent at the facility. General observations indicate the largest user groups on a normal basis are vehicles parked during lunch/break periods or visitors coming to the facility to take in the view, while the largest water-based user is accessing dinghies stored at the facility.

2.3 Parking Requirements

As noted above, the largest restriction to improved operations of the Falmouth Anchorage is the availability of parking. Not only is parking limited at the Falmouth Landing but on peak days parking it is at a premium throughout the Falmouth waterfront. Peak days include large race events held by Portland Yacht Club as well as excellent boating days during many summer months and occurs quite regularly. To better understand the overall parking requirements, each primary access point was observed with the intent of identifying improvements at the Town Landing facility.

2.3.1 *Handy Boat Service*

Handy Boat Service provides parking for all of their services in two lots; one located close to the waterfront adjacent to the dock area and a second, larger lot located above/behind the building. Depending on operational changes, such as boat maintenance and storage levels, the total number of parking spaces changes throughout the season. The maximum number of parking spaces that could be achieved at Handy Boat Service approaches 225 parking spaces.

The total number of parking spaces serves all business functions, including boat sales, the sail loft, restaurant space, and employees. Based on required parking by Falmouth Zoning Ordinances, approximately 60 parking spaces would be occupied by non-boating users at peak times, leaving 165 parking spaces for mooring holders. With an operation serving ~400 moorings, a ratio of 1 parking space per 2.9 moorings is provided.

2.3.2 *Portland Yacht Club*

Portland Yacht Club provides parking for their members to access the Falmouth waterfront and facilities, including racing programs, dining room, and meeting space. The parking lot at Portland Yacht Club is a standard paved parking area with 100 clearly marked parking spaces. Additional room is provided in non-marked areas but is not utilized in a typical day. Based on their operation, approximately 15 spaces would be occupied by employees of the club leaving 85 spaces for mooring holders. With a club serving ~335 moorings, a ration of 1 parking space per 3.9 moorings is provided.

2.3.3 *Existing Parking at Town Landing*

The Town Landing currently has three available parking areas, one off-street area located directly adjacent to the Town landing (the “landing parking lot”), one off-street area located at the intersection of Foreside Road (Route 88) and Johnson Road (the “market parking lot”), and available on-street parking along Johnson Road. There is available on-street parking on Foreside Road (Route 88) except

that it has a 2-hour parking limitation in the immediate vicinity of the Town Landing Market; this area was not considered in the evaluation.

The dock parking lot supports 28 vehicles, with 19 striped parking spaces including two Harbormaster spaces, one handicap space, and 16 striped spaces located on the north side and ~9 unmarked spaces on the south side that can be occupied depending on the tide conditions. During a typical day or weekend, these spaces are occupied with long term users, such as boat owners or commercial fisherman. In addition to these 28 spaces, there are 5 on-street parking spaces located on Town Landing Road just west of the landing parking lot.

The market lot supports 22 vehicles and 6 trailer spaces, which includes 16 parking spaces reserved for Falmouth residents and 6 spaces for non-residents. The parking lot requires one-way circulation entering from Johnson Road and exiting on Foreside Road. This lot acts as a small overflow lot when the landing parking lot is full. However, due to the limited number of non-resident parking spaces, this lot fills up quickly and non-residents are relegated to finding available parking on Johnson Road or other non-marked spaces.

The available parking on a typical day includes 50 parking spaces in the two parking lots, 5 spaces on Town Landing Road, and approximately 10 to 20 parking spaces along Johnson Road. However, unlike Handy Boat Service and the Portland Yacht Club, this serves both water-based and land-based users at the public facility. The land-based users have short term parking demands and include high turnover rates. The water-based users have long term needs that are in conflict with other users. Assuming that 15 parking spaces are occupied by non-boaters (20% of the available total), the Town Landing with access to ~350 moorings and 60 parking spaces provides a ratio of 1 space per 5.8 moorings.

2.4 Conclusion and Recommendations

The available parking for the users of the Town Landing is inadequate for the current operation. Long-term improvements are needed to meet the current demand, and any future increase in the number of moorings should consider an equivalent increase in the parking areas. The construction of new parking spaces in a large parking area costs between \$2,000 and \$2,500 per space based on the land being used. To meet the needs of the Town Landing users, the following recommendations should be considered:

- 2.4.1 Maintain the mooring moratorium until adequate parking facilities are developed; any expansion of the Falmouth Anchorage through the Town Landing access point would only exacerbate a deficient condition. The current parking facilities could reasonably support ~250 mooring owners, not the current 350 being served.

- 2.4.2 Other primary access points have adequate facilities to support additional mooring owners. The current parking facilities at Handy Boat Service and Portland Yacht Club can sustain additional mooring owners with no changes, while private access points will have negligible impacts of the Falmouth Anchorage operation.
- 2.4.3 Develop a parking lot for 88 vehicles (using a minimum of 1 parking space per 4 moorings) to accommodate the existing 350 mooring owners and an additional boat trailer storage for 10 trailers. This should be considered the first phase in addressing the deficiencies that exist today, with an approximate construction cost of \$220,000 not including land acquisition, design, and permitting fees.
- 2.4.4 As determined by the Committee, additional parking spaces should be developed for any future moorings to be accessed through the Town Landing. The total number of additional parking spaces is directly tied to the ability to access a mooring. Given the current dinghy utilization discussed in Section 3.0, we discuss that a maximum of 400 moorings can access through the Town Landing. With an additional 50 moorings to the Town Landing, we recommend an additional 15 spaces be constructed to allow for future growth, with an approximate construction cost of \$30,000 not including land acquisition, design, and permitting fees.
- 2.4.5 As future parking would be seasonal in nature and maintenance would not be required in the winter for mooring access, we recommend the Town consider the construction of a structural grass parking area using open concrete pavers or similar product to allow for a more environmentally friendly project.

Once the necessary parking areas have been developed, a review of the mooring moratorium could be considered along with the following recommendations to improve the operation of the Town Landing:

- 2.4.6 Restrict the landing parking area to a maximum of 1-hour parking. This will allow more short term parking of land-based users as well as increase the available parking for the loading and unloading of gear for water-based users.
- 2.4.7 Restrict the non-marked parking spaces on the south side of the dock parking area for commercial users to improve and facilitate their business.
- 2.4.8 Consider changes to the allocation of resident parking spaces in the market parking area, or develop a parking time restriction to encourage the use of the new long-term parking area to be developed.

3.0 DINGHY UTILIZATION AND LAUNCH SERVICE REQUIREMENTS

3.1 Observation of Dinghy Utilization

The Town Landing currently allows 90 dinghies to be stored at the “dinghy dock” attached to the main pier. As outlined in the Phase I report, this permit system is contentious, creates additional work for the Harbormaster and staff, and increases the liability during inclement weather. As noted in the Town Landing utilization, the numbers of dinghies accessed and launched were noted during observations. The highest level of usage was 34 dinghies used in a one hour period on July 4th, 2007. A more typical level of usage observed was 10 to 15 dinghies used in a one hour period. These usage levels include dinghies stored at the Town Landing and those transported by a vehicle.

3.2 Dinghy Fleet Option

In addition to the current 90 dinghies permitted at the Town Landing, the Town recently purchased three dinghies for public use within the Falmouth Anchorage. The operation of the public dinghies is governed by a set of rules enforced by the Harbormaster, including an age restriction, use of approved flotation devices, a 30-minute time limit, and users must provide their own oars (no motors allowed).

One option that has been discussed is to remove all personal dinghies from the Town Landing and maintain a dinghy fleet as an extension of the three public dinghies. All mooring holders would have the option to launching their own dinghy to access their mooring or utilize one of the public dinghies. The Committee would develop operating rules and the Harbormaster would enforce and make all emergency decisions regarding the use of the fleet.

The implementation of a dinghy fleet has been used at some organizations to alleviate the need to store personal dinghies. However, as a public facility, there is increased liability that would need to be addressed through the proper means and funding for the purchase and maintenance of the dinghy fleet would have to be developed. This option highlights two primary goals, the eventual elimination of the private dinghy storage at the Town Landing, and the eventual need for a launch service to provide adequate facilities for the Falmouth Anchorage and the Town Landing access point.

3.3 Launch Service Option

When adequate parking facilities are constructed to support an increase in the number of moorings accessed through Town Landing, the next significant restriction will be the ability to get from the dock to the mooring, and/or the ability to launch a dinghy. This point is much harder to determine but operational delays and contention about dinghy storage indicate that dinghy use as a stand-alone method is proving difficult to maintain. Launching 34 dinghies per hour to serve 350 moorings is a significant volume and creates

safety issues not only at the dock but also throughout the anchorage area. Boats exiting and entering the anchorage not only have to worry about their intended route and other moored vessels, but the large numbers of dinghies adds to the inherent safety risks.

The ideal solution to manage access from the Town Landing in the long-term would be to operate a launch service that delivers boat owners and guests to their boats without the need for dinghy use, except when needed by the owner on longer trips. However, as noted earlier about trends in the utilization data, a significant change such as a launch service will alter the current levels of access and increase the number of people using their boats. In general terms, the existing limits on dinghy storage and the time required getting to the mooring limits a boaters decision to go out on the water. By operating a launch service that significantly reduces the time and burden of transporting, rowing, and returning to the dock with a dinghy will only increase the number of times an owner will want to access their boat. All of these variations in trends are difficult to gauge and reasonable assumptions when determining feasibility must be made.

The two options for a launch service include a town-operated service or a commercial service that operates from the Town Landing; each will be described briefly in the following sections. At this time, it is worth noting that each option has a direct economic impact on other businesses that service the Falmouth Anchorage. As the Town Landing develops more and more services as an access point, including adequate parking and a launch service, then existing private businesses that provide similar services would be impacted. The Town operates at a nominal fee by spreading the Town Landing costs across all mooring owners while only a quarter of the moorings are accessed through the facility. Appropriate consideration should be given to businesses and other landowners who do not rely on the services of the Town Landing when developing financial models.

3.3.1 Town-Operated Launch Service

Similar to many municipal services, the Town can purchase, maintain, and operate a launch for the Town Landing access point. There would be a corresponding increase in manpower needs under the direction of the Harbormaster. The major assumption would be to determine the operating hours for a launch service from Town Landing. Currently, Handy Boat Service and Portland Yacht Club operate from 8 AM to 9 PM, sometimes to 10PM. However, other private enterprises in Maine operate fewer hours to follow a more typical day from 8 AM to 6 PM. Outside of these hours the boat owner would have to rely on their private dinghy. In most cases, a launch service in Maine is operated from Memorial Day to Columbus Day, or approximately 22 weeks a year.

The Phase I report provides a general description of the necessary equipment required to operate and maintain a launch vehicle. Based on a review of typical specifications and communications with local operators, the following yearly financial model could be anticipated by the Town:

Yearly Expenses for Town-operated Launch Service:

Capital depreciation (10%*)	\$16,000
Payroll expenses	\$34,000
Operating expenses	\$20,000
<u>Maintenance expenses</u>	<u>\$20,000</u>
Total yearly costs to operate launch service	\$90,000

* Assumes a capital expenditure of two (2) launch vehicles at a cost of \$80,000 per vehicle (\$160,000 total expenditure), with a depreciation of 10% per year.

In order to be equitable to all anchorage users, the cost to operate a launch service would be supported by the users who access their mooring from the Town Landing facility. Based on 400 moorings, the cost would be in the range of \$225 to \$250 per mooring each year based on actual yearly expenses.

3.3.2 Privately Operated Launch Service

A privately operated launch service would operate in a similar manner to a town operated service, except for an increase in cost for items such as overhead, insurance and profit required to operate a business. As noted in the Phase I report, the operation of a private launch service would require the discontinuance of all private dinghy storage at the Town Landing. The financial model would vary but the Town could reasonably expect the same level of service from a private launch service with less operational demands on current staff, i.e. the Harbormaster and Committee.

3.4 Conclusion and Recommendations

The use of dinghies from Town Landing as the sole source of access is reaching its limit. The current system of storage of dinghies creates significant burden for the Harbormaster and his staff, does not adequately meet the needs of the users given only 1 in 4 boat owners are permitted for the year, and the allotment of dinghy storage appears to be inequitable. In order for the Town Landing access point to improve operations and allow for unrestricted increase in the number of moorings, a launch service is the only means to achieve these goals. The following recommendations should be considered to achieve improved waterfront access:

- 3.4.1* Develop a plan to increase and support the public dinghy fleet from 3 dinghies to 10 dinghies, with a corresponding decrease in the number of personal dinghies stores at the “dingy dock.” The goal of the dinghy fleet would be to remove all of the personal dinghies except for commercial users and those required to achieve compliance with ADA requirements. The current operation of personal dinghies and 3 public dinghies would be capable of supporting 400 mooring users through the Town Landing.

- 3.4.2 Investigate the feasibility of a privately operated launch service. The Committee should agree to a minimum level of service (similar to regulations on mooring companies) and work with a local operator to develop an acceptable financial model that will service the Town Landing. As a private business, the operating hours and conditions need to be developed in a way that supports the financial health of the operation with a minimum level of service expected.
- 3.4.3 If no private service is acceptable and continued growth is desired, the Town should consider expanding services at the Town Landing to include a launch service. Normal operating hours should be 8 AM to 6 PM, 7 days a week, from Memorial Day to Columbus Day weekends (adjustable from year to year). The launch service should be funded by users of the Town Landing facility (similar to the launch fee paid for by users of the launch ramp) and not all mooring permit holders. The operation with limited hours would provide a minimum level of service while reducing the impact on local businesses.
- 3.4.4 Based on the typical number of dinghies used in a one hour period, we recommend a minimum 20 person launch vessel that could serve 10 to 15 moorings in one round trip. During peak demand, a second launch vessel could be used to support the Town Landing users.
- 3.4.5 The funding of a launch service should be borne by those users of the Town Landing access point. Spreading the cost to all mooring holders would be inequitable, as other access points do not impact the Town Landing level of operation. A fee structure should be developed for yearly and per trip fees.
- 3.4.6 Critical to either recommendation above and for overall safety, the Town should remove all private dinghy storage from the Town Landing except those for commercial users, persons with disabilities under ADA guidelines, and town-owned dinghies if maintained. Private dinghies should be discouraged unless needed by the boat owner for longer trips and boating needs.
- 3.4.7 In the case that a launch service is not feasible or implemented, the Town Landing facility will begin to see a critical operational point where no additional mooring permits can be issued due to dock congestion. In order to self-regulate the Town Landing access point, all mooring permit holders should be required to bring their own dinghy resulting, again, in a recommendation to remove all private dinghies from the Town Landing. The effort required to reach a mooring will limit the number of users on a daily basis, thereby maintaining a sustainable level of operation until expansion of services becomes feasible.

4.0 ANCHORAGE-WIDE REPOSITIONING OF MOORINGS

4.1 Mooring and Mooring Field Design

The current mooring field represents long-term growth in mooring demand with very limited active management, which creates “organized chaos” with respect to boat location and anchorage efficiency. Observations on the water and through boat mapping indicate a haphazard array of mooring locations with little forethought to future growth and planning for such a large anchorage. While this is a general statement about the Falmouth Anchorage, it is not representative of all mooring areas in the anchorage.

Expansion of the mooring field and the addition of new moorings over time created significant congestion in and around the Town Landing access. This congestion is limited to areas north and south of the Town Landing fairway, with some limited congestion in and around the Portland Yacht Club fairway. Due to the available room in and around the Handy Boat Service, proper planning and placement of moorings has created minimal congestion in the south end of the Falmouth Anchorage. Another critical area of mooring field design that is limited in the Falmouth Anchorage is the existence of accessible fairways, or open passage ways, to allow boat owners to reach the access point or open water.

A number of factors are related to create a proper mooring installation, including depth of water, length of scope (chain), length of pennant, boat type and size, and acceptable buffers around each mooring position. We reviewed the existing mooring database, Ordinance language, and proposed GIS-based software with the goal of identifying a more organized and efficient management of mooring installation. While the Ordinance does provide guidelines for mooring weight by boat length, there are still many variables in the mooring design that are left vague and that creates a difficult management situation. Other harbors and mooring areas in Maine have clearly defined limits for mooring weight, scope length and size per allowable boat size.

Given a more organized approach to mooring installation requirements and a predictable safety radius around each position, the mooring field layout can be developed and inefficiencies can be addressed. A mooring field should be laid out along common lines so that paths between adjacent rows of boats allow for vessels to exit the mooring field. Additional, dedicated fairways should be included to allow safer access in and around the mooring field without constantly changing course. The most efficient layout of a mooring field is to utilize equilateral triangles between mooring positions, or based on a grid layout of 3 points. This triangle maximizes the available room and minimizes the chance of boat collisions. In an ideal scenario, no two safety radius around a mooring position would overlap, but give the current configuration and proximity to the access points, this is unattainable.

Overall, recommendations for a mooring installation and mooring field layout are included in Section 4.4 below. The Falmouth Anchorage is very large with significant room for expansion when strictly looking at available geometry. As indicated in the Phase I report, the Falmouth Anchorage is capable of reaching ~1,700 moorings near full build-out. However, we do not foresee the necessary land-side facilities being developed to reach this number; the access points, available parking, and launch capability will always be the limiting factor when determining the maximum number of vessels allowed in the Falmouth Anchorage. See Appendix B for design parameters of a grid layout.

4.2 Immediate Safety Issues

We reviewed the mooring database, as modified by the GIS-based management software, to identify critical safety issues. We defined a critical safety issue as when one mooring position is located within the safety radius of another mooring position. This direct overlap is critical during slack tide and low wind conditions on the water; two boats with different water profiles may rotate in opposite directions creating an immediate safety hazard. Those immediate safety hazards were identified and should be addressed by the Harbormaster as an immediate safety issue. See Appendix C for a list of moorings that require review, and action if necessary, as identified from Figure 1, Appendix D.

4.3 Anchorage-Wide Repositioning

The ideal goal on the long-term management and operation of the Falmouth Anchorage is to develop an efficient mooring field layout based on specific mooring positions based and proper mooring design. Given the total number of moorings already installed, it is not feasible to relocate every mooring and place it in a corrected position at one time. The Harbormaster would actively manage the repositioning over the course of 6-8 years to adjust, relocate, and reach a proper operational level.

Building on the mandatory inspections of moorings every two years, an anchorage-wide repositioning can be done gradually, starting on the outer edges of the mooring field and gradually working towards the primary access points with the highest degree of congestion. As moorings are lifted and inspected by the mooring operator, the mooring can be repositioned in close proximity to its current location. The new mooring position can be determined using the GIS-based software management tool based on the locations shown in Figure 2, Appendix D, and during the inspection the mooring will be lifted and relocated at no additional cost to the owner or Town.

A proposed anchorage-wide position map, shown in Figure 2, Appendix D, was prepared using the recommendations in Section 4.4 for mooring design and layout. The GIS-based information used to generate this layout will be provided to the Harbormaster for future use in managing the anchorage. As many variable are involved, final decisions by the Committee during implementation of the long-term management plan may require adjustments to the proposed positions.

4.4 Conclusions and Recommendations

The Falmouth Anchorage is experiencing the effects of years without a long-term management and operations plan. Mooring installations and locations occurred haphazardly over the years with no plan for future growth. In order to improve the operation of the waterfront and reduce safety issues, we recommend the following actions be considered:

- 4.4.1 Amend the Coastal Waters Ordinance so that minimum and maximum mooring design shall be allowed based on a range of boat sizes. The minimum chain scope shall be two (2) times the mean high water depth and a maximum of two and one quarter (2.25) times the high water depth.

Boat Length	Mooring Weight (min.)	Lower Chain Size (min.)	Upper Chain Size (min.)	Pennant Length (max.)
Up to 15'	200 lbs	1/2"	1/2"	12'
Up to 20'	250 lbs	1/2"	1/2"	15'
Up to 25'	300 lbs	5/8"	1/2"	18'
Up to 30'	400 lbs	5/8"	1/2"	20'
Up to 35'	500 lbs	3/4"	1/2"	20'
Up to 40'	600 lbs	3/4"	1/2"	25'
Over 40'	1000 lbs*	1"*	1/2"	30'

* Mooring for boats larger than 40 feet shall be reviewed by the Harbormaster and the mooring weight and chain size shall be agreed to before installation.

This recommendation is utilized in the mooring field layout to determine the allowable swing radius for a given depth of water.

- 4.4.2 As soon as reasonably possible, such as the end of the 2008 boating season, take action to alleviate immediate safety issues identified on the existing conditions map and moorings identified in Appendix C. Moorings should be moved to a new location suitable for the boat size and mooring design, preferably to a position on the anchorage-wide map.
- 4.4.3 We recommend that moorings be grouped by the above listed boat length range, and mooring assignments within the Falmouth Anchorage should be placed in similar groups for maximum efficiency and safety. Any change in the boat size from one year to the next shall review, and potentially require, the relocation of a mooring assignment to a new group.
- 4.4.4 The Harbormaster should work with the mooring operators and inspectors to reposition the moorings to pre-determined GPS positions using the GIS-base management software. Any mooring moved within the existing safety radius of the boat, based on Figure 1, Appendix D, should be done during the next scheduled inspection if there is available safety area

around the boat. If a mooring is moved beyond the existing safety radius of the boat, the Harbormaster should notify the mooring owner of the new location and determine if a preferred alternative exists. Ultimately, the Harbormaster maintains the right to relocate mooring assignments on a yearly basis and the Ordinance provides relief for affected owners.

FALMOUTH ANCHORAGE EVALUATION

FALMOUTH ANCHORAGE EVALUATION

APPENDIX B

PROPOSED REPOSITIONING CALCULATIONS

FALMOUTH ANCHORAGE EVALUATION

PROPOSED MOORING LAYOUT							
Boat Size	Chain Length (Max. MHW)	Max. Safety Radius	Grid Spacing*	Triangle Spacing**	Current Total No. of Moorings <small>(From database)</small>	Proposed No. of Moorings <small>(Primary Access Points)</small>	Proposed No. of Moorings <small>(Waites Landing)</small>
Up to 15'	40'	65'	50'	43'	42	115	20
Up to 20'	45'	80'	60'	52'	236	315	18
Up to 25'	50'	90'	68'	59'	250	360	28
Up to 30'	55'	100'	75'	65'	226	345	20
Up to 35'	60'	115'	86'	75'	193	245	7
Up to 40'	70'	130'	98'	85'	143	170	10
Over 40'	80'	150'	112'	97'	72	110	7
Total No. of Moorings					1162	1660	110

* Assumes that the grid spacing will be 75% of the maximum safety radius.

** Assumes equilateral triangles spaced at 86.6% of the grid spacing.
